REACH OUT AND READ: THE EVIDENCE

Research shows that when pediatricians promote literacy readiness according to the Reach Out and Read model, there is a significant effect on parental behavior and attitudes toward reading aloud, as well as improvements in the language scores of young children who participate. These effects have been found in ethnically and economically diverse families nationwide.

The body of published research supporting the efficacy of the Reach Out and Read model is more extensive than for any other psychosocial intervention in general pediatrics. Additional studies about Reach Out and Read that address language outcomes in children are in progress. To read the complete articles, visit reachoutandread.org/why-we-work/research-findings/.

The following studies by independent academic researchers have been published in peer-reviewed medical journals:

REACH OUT AND READ: CHANGING CHILD OUTCOMES

**Mendelsohn et al., Pediatrics** High-risk urban families participating in Reach Out and Read read more frequently to their children. Children exposed to Reach Out and Read had higher receptive language scores (words the child understands) and expressive language scores (words the child says). Increased exposure to Reach Out and Read led to larger increases in both receptive and expressive language scores.

**High et al., Pediatrics** Families participating in the Reach Out and Read model read to their children more often (4.3 vs. 3.8 days/week), and their toddlers' receptive and expressive vocabulary scores were higher. This effect held in parents of different levels of education and English proficiency.

**Theriot et al., Clinical Pediatrics** Among children ages 33 months to 39 months attending a well-child clinic in Louisville, KY, expressive and receptive vocabulary scores were significantly and positively associated with both the number of Reach Out and Read-enhanced well-child visits they had attended, and with the number of books purchased for them by their parents. This finding supports a "dose effect" for the Reach Out and Read intervention: the more visits, the higher the score.

**Sharif et al., Journal of the National Medical Association** Children participating in Reach Out and Read had higher receptive vocabulary scores. They also had higher scores on the Home Literacy Orientation (measured by how much the child was read to and how many books were in the home) than children not participating in Reach Out and Read.

**Diener et al., Journal of Community Medicine and Health Education** This study showed that a small sample of Latino children who participated in Reach Out and Read from six months of age had average or above average literacy skills by the end of kindergarten, as well as high-quality home literacy environments with frequent book sharing and high book ownership.

The following studies by independent academic researchers have been published in peer-reviewed medical journals:

BOOKS BUILD BETTER BRAINS

WHEN PEDIATRICIANS PROMOTE READING READINESS, LANGUAGE SCORES IMPROVE.

REACH OUT AND READ: CHANGING PARENTAL ATTITUDES AND PRACTICES

**High et al., Archives of Pediatrics and Adolescent Medicine** Parents whose children (< 3 years) had received books and educational materials during well-child visits were more likely than parents in a control group to report that they shared books with their children, and to cite sharing books as a favorite activity or a child's favorite activity.

continued on back
Parents who had received a book as part of Reach Out and Read were more likely to report reading books with their children, or to say that reading was a favorite activity. The benefits of Reach Out and Read were larger for families receiving Aid to Families with Dependent Children.

Weitzman and colleagues, in a study using direct observation of children’s homes, found that parents were more likely to read aloud to their children and enjoy reading together when their families had more encounters with the Reach Out and Read program.

Needelman and colleagues, in a multicenter study, found that families exposed to Reach Out and Read were more likely to report reading aloud at bedtime, read aloud 3 or more days per week, mention reading aloud as a favorite activity, and own 10 or more children’s books.

Silverstein and colleagues, in a study of English and non-English speaking families who participated in the Reach Out and Read model, increased their weekly bedtime reading, and more parents reported reading as their own or their child’s favorite activity. For non-English speaking families, the number of children’s books in the home also increased as a result of the Reach Out and Read model.

Sanders and colleagues, in a study of Hispanic parents participating in Reach Out and Read, found that more parents were more likely to report reading to their children compared to Hispanic parents not participating in Reach Out and Read. When parents read more frequently to their children, they were also more likely to read frequently themselves.

Govala and colleagues, in a study of Hispanic parents whose children had received bilingual books, educational materials, and anticipatory guidance about literacy, found that more parents were more likely to report reading books with their child at least 3 days/week (66% vs. 24%) and report that reading books was one of their three favorite things to do with their child (43% vs. 13%) than parents in a control group. Parents participating in the Reach Out and Read intervention also tended to have more books in the home (for children and adults).

Jones and colleagues, in a study of parents participating in Reach Out and Read, found that more parents were more likely to rate their child’s pediatrician as helpful than those not participating. Pediatricians in the Reach Out and Read group were more likely to rate parents as receptive than those in the non-Reach Out and Read group. Mothers in the Reach Out and Read group were two times more likely to report enjoyment in reading together with their child than those in the non-Reach Out and Read group.

King and colleagues, in a study of successful implementation of the Reach Out and Read program, found that successful staff at clinics that struggled to implement Reach Out and Read found their jobs burdensome and reported lacks in communication. Staff at successful Reach Out and Read program sites worked as a team and expressed strong commitments to their communities.

Byington and colleagues, in a qualitative study, examined the thank-you notes sent to staff at a Reach Out and Read clinic by Hispanic families. Families expressed thanks for the books received, as well as the literacy advice given by doctors and nurses. Many families believed that the books and advice promoted the habit of reading and demonstrated respect for the families and their children.
